COMMENT Coding sequences below are predicted from computer analysis, using predictions from Genefinder (P. Green, U. Washington), and other available information.
For a graphical representation of this sequence and its analysis see:-
http://webace.sanger.ac.uk/cgi-bin/display?db=wormace&class=Sequence &object=C46F11
Current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.
IMPORTANT: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.
IMPORTANT: This sequence is not the entire insert of clone C46F11. It may be shorter because we only sequence overlapping sections

            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone C46F11 is at 45409 in
            sequence Z48241.
            The true right end of clone C46F11 is at 8174 in
            sequence Z48245.
            The start of this sequence (1..102) overlaps with the end of
            sequence Z48241.
            The end of this sequence (34740..34841) overlaps with the start of
            sequence Z48245.

            [FUNCTION] THE VASA PROTEIN IS REQUIRED ONLY IN THE FEMALE GERM
            LINE. IT IS IMPORTANT FOR OOCYTE FORMATION AND IN THE SPECIFICATION
            OF THE POSTERIOR STRUCTURES OF THE EMBRYO.
            [DEVELOPMENTAL STAGE] MATERNALLY EXPRESSED (DURING OOGENESIS).
            FUNCTION DURING EARLY EMBRYOGENESIS.
